DNA (cytosine-5-)-methyltransferase (EC 2.1.1.37) T6G15.160 - Arabidopsis thaliana N.Alternate names: protein T6G15.160
C:Species: Arabidopsis thaliana (mouse-ear cress)
C:Date: 23-Apr-1999 #sequence_revision 23-Apr-1999 #text_change 05-May-2000
C:Accession: T06663
R:Bevan, M.: Murphy, G.; Ridley, P.: Hudson, S.; Bancroft, I.; Mewes, H.W.; Mayer, K.F.X submitted to the Protein Sequence Database, April 1999
A:Reference number: 215791
A:Residues: 1-1404 <BEV>
A:Residues: 1-1404 <BEV>
A:Residues: 1-1404 <BEV>
A:Cossion: T06663
A:Molecule type: DNA
A:Residues: 1-1404 <BEV>
A:Cossion: T0665
A:Experimental source: cultivar Columbia; BAC clone T6G15

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melitin signal peptide, (His)6 tag. T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CBP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (AMP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium faltiparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monoclonal antibodies useful in vaccines against malaria transmission - recognise continuous epitope in the sexual stages of

                                                                                                                                                The present sequence is the antigenic epitope P591, derived from gamete specific antigen, Pfg27 of the sexual stage of Plasmodium falciparum. It is used in the construction of recombinant protein comprises, melitinis signal peptide, (His)6 tag. The recombinant protein comprises, melitini signal peptide, (His)6 tag. The recombinant protein comprises, melitini signal peptide, (His)6 tag. Treell epitope from tetanus toxoid and 21 antigenic epitopes from Treell epitope from tetanus toxoid and 21 antigenic epitopes from Treell epitope antigen-1 (LSA-1), merozoite surface protein-2 (SSP-2), SMSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; SSP-2; circumsporozoite protein; CSP; sporozoite surface protein:2; SSP-2; apical membrane antigen:1; LSA-1; merozoite surface protein-1; MSP-1; MSP-2; BBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pf927; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA
                                                                                                                             AAR96217 is a continuous epitope derived from Plasmodium falciparum in the sexual stage of development. The epitope was identified using monoclonal antibodies (MADS) 686, 1662, 19F1 and 11612 (ATCC HBILIS5, HBILIS6, HBILIS7, HBILIS7, HBILIS7, HBILIS7, HBILIS7, HBILIS7, HBILIS7, HBILISS, HBI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used in vaccination The nucleic acids (I) may be used to produce the used to produce hosts cells which express the polypeptides. (II) (and/or nucleic acids) may then be polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other Inhibitors of their activity and therefore identify compounds that may be used for the reatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 to the present invention of the present invention.

N. B. The present invention specifically claims all the polynucleotide sequence listing of the present specification,
                                                                                                                                                                                                                                                                            ö
                AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4465 to 4464.
                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

    S. epidermidis open reading frame protein sequence SEQ ID NO:1110.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent oitiis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                            Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis;

CAFI protein has been shown to bind to another transcription factor CCR4 and regulate the expression of glucose-repressible alcohol dehydrogenase (ADH2) gene. The present sequence is useful for producing transgenic plants with altered various genes or transgenes. The CAFI protein may also be used to design or identify inhibitors of cell metabolism that may be useful as herbicides.

AAW09620-W09625 are modified lipase sequences derived from Pseudomonas
                                                                                                                                                     New polypeptide with lipase activity – used for prodn. of fatty acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 glumae lipase modified to have reverse stereoselectivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pseudomonas; Chromobacterium; modification; variant; optical isomer; steroeselectivity; drug preparation; 1,4-dihydropyridine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lipase of modified stereo:selectivity - useful for prepn. of optically active isomer 1,4-di:hydro:pyridine cpd., as intermediate
                                                                                                                                                                                                                                  The polypeptide has good stability and high lipase activity. I for prodo. of fatty acids from triglycerides, as a reagent for quantitative analysis of troglycerides, and as a catalyst for transesterifying fats and oils.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "wild-type Phe replaced with Leu,
important substitution for producing
a lipase of reverse stereoselectivity"
                                                                                                                                                                                                                                                                                                                                                             DB 10; Length 319; 32;
                                                                                                                                                                                                                                                                                                                                                                                                           Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a CAF1 (also known as POP2) transcription factor from srl.pk0126.b4 clone isolated from soybean root cDNA library srl. CAF1 protein has been shown to bind to another transcription factor CCR4 and regulate the expression of glucose-repressible alcohol dehydrogenase (ADH2) gene. The present sequence is useful for producing transgenic plants with altered levels of POP2/CAF1 transcription factor to control expression of various genes or transgenes. The CAF1 protein may also be used to design or identify inhibitors of cell metabolism that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The lipase variants were created in an attempt to find important substitution sites that affect the stereoselectivity of the lipase enzyme. Important substitutions found for Pseudomonas species were Phe221Leu, Val266Leu and Lau2871Le. Lipase variants of reverse stereoselectivity are used to produce optically active 1,4-dihydropyridine which is an important intermediate compound in
species cepacia and glumae and from Chromobacterium viscosum (AAW09625 only). The lipase variants were created in an attempt to find important substitution sites that affect the stereoselectivity of the lipase enzyme. Important substitutions found for Pseudomonas species were Phe221Leu, Val266Leu and Leu2871le. Lipase variants of reverse stereoselectivity are used to produce optically active
                                                                                                                                                                                                                                                                                                                                                                                                                                Pseudomonas glumae lipase modified to have reverse stereoselectivity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                             /label= substitution
/note= "Thr to Tyr, in wild-type sequence a Thr residue
is present at position 129 of mature P. glumae
lipase"
                                                                                                                                                                                                                                                                                                                                                                                  Mutant; lipase; enzymatic detergent; substitution; variant; improved; hydrophobicity.
sequences are based upon the wild-type P. glumae sequence disclosed in EP407225-A (UNILEYER PLC). The lipase variants may contain one cor more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules; the lipase variants show improved in the-wash lipolytic activity and may
                                                                                                                                                                                Gaps

/note* "Leu to Arg, in wild-type sequence a Leu residue is present at position 134 of mature P. glumae
                                                                                                                                                                          AAR88009-R88018 are protein variants of Pseudomonas glumae lipase. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant; lipase; enzymatic detergent; substitution; variant; improved;
                                                                                                                                                                                     sequences are based upon the wild-type P. glumae sequence disclosed in EP40725-A (UNILEVER PLC). The lipase variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. the lipase variants show improved in the wash lipolytic activity and may be used in enzymatic detergent compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                    Pseudomonas lipase variant with increased surface hydrophobicity has improved in-the-wash performance, useful in enzymatic detergent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          "possible site for Thr to Leu substitution"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant; lipase; enzymatic detergent; substitution; variant; improved; hydrophobicity.
                                                                                                                                                                                                                                                                 AAR88009-R88018 are protein variants of Pseudomonas glumae lipase. The sequences are based upon the wild-type P. glumae sequence disclosed in EP407255-A (UNILEYER PLC). The lipase variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. The lipase variants show improved in the wash lipolytic activity and may be used in enzymatic detergent compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                       Pseudomonas lipase variant with increased surface hydrophobicity has improved in the wash performance, useful in enzymatic detergent

AAR88009-R88018 are protein variants of Pseudomonas glumae lipase. The sequences are based upon the wild-type P. glumae sequence disclosed in Ep407225-A (UNIEUREVER PLC). The lipses variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. the lipase variants show improved in the wash lipolytic activity and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pseudomonas lipase variant with increased surface hydrophobicity has improved in-the-wash performance, useful in enzymatic detergent

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3, 7 Sequence 3, 7 Sequence 2, 8 Sequence 2, 8 Sequence 5, 8 Sequence 20, 8 Seque

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 10, Application US/08449015
Patent No. 5804409
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: FRENKEN, Leon G.
APPLICANT: VESRER, Christiaan
TITLE OF INVENTION: PRODUCTION OF ACTIVE PSEUDOMONAS GLUMAE
TITLE OF INVENTION: LPASE IN HOMOLOGOUS OR HETEROLOGOUS HOSTS
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
                                                                                         APPLICANT: BOS, Jannetje W.
APPLICANT: FERNERN, Leon G.

                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 3, Application US/08261822A
Patent No. 565053
GENERAL INFORMATION:
APPLICANT: EXAMPLE TITLE OF INVENTION: Plant Genes for Sensitivity to Ethylene TITLE OF INVENTION: and Pathogens
NUMBER OF SEQUENCES: 82
CORRESPONDENCE ADDRESS:
ADDRESSEE: Woodcock, Washburn, Kurtz, Mackiewicz & No. 565
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 1321;

Sequence 8, Application US/08424268

Sequence 8, Application US/08424268

Patent No. 5821118

GENERAL INFORMATION:
APPLICANT: Omer, Charles A
APPLICANT: Omer, Charles A
APPLICANT: Gibbs, Jackson B
APPLICANT: Kohl, Nancy E
APPLICANT: Kohl, Nancy E
TITLE OF INVENTION: Assay for Inhibitors of Farnesyl-Protein
TITLE OF INVENTION: Transferase
                APPLICANT: Brown, Michael S.
APPLICANT: Brown, Michael S.
APPLICANT: Goldstein, Joseph L.
APPLICANT: Reiss, Yuval
TITLE OF INVENTION: Tetrapeptide-Based Inhibitors of Farnesyl
TITLE OF INVENTION: Transferase
NUMBER OF SEQUENCES: 8
CORRESPONDENCE ADDRESS:
ADDRESSEE: Arnold, White & Durkee
STREET: B.O. Box 4433
CITY: Houston

"Isolation and identification by sequence homology of a putative cytosine methyltransferase from Arabidopsis thaliana.";
Nucleic Acids Res. 21:2383-2388(1993).
-i FUNCTION: METHYLATES CG RESIDUBS.
-i CATALYTIC ACTIVITY: S-ADENOSYL-L-METHIONINE + DNA = S-ADENOSYL-L-HOMOCYSTEINE + DNA CONTAINING 5-METHYLCYTOSINE.
-i SIMILARITY: LOW, TO OTHER EUKARYOTIC DNA METASE.
-i SIMILARITY: SOME TO BACTERIAL RESTRICTION SYSTEMS
METHYLFRANSFERASES.

                                                                                                                                                                                                                                                                                                                                                                                                                                         NATURE 392:353-358(1998).

-I FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER.

-I CATALYTIC ACTIVITY: ATP-INDEPENDENT BREAKAGE OF SINGLE-STRANDED DNA, FOLLOWED BY PASSAGE AND REJOINING.
-I SUBUNIT: MONOMER (BY SIMILARITY).
-I SUBUNIT: MONOMER (BY SIMILARITY).
-I MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME SADIND.

AT ONE END OF THE ENZYME-SEVERED DNA STRAND.
-I SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOISOMERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

SUBJULET C.T.C., Urbanus J.H.M., Planta R.J.;

Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: BRINDS TO SINGLE-STRANDED SEQUENCES PARTICIPATING IN DNA

-! FUNCTION: BRINDS TO SINGLE-STRANDED SEQUENCES PARTICIPATING IN DNA

REPLICATION IN ADDITION TO THOSE MEDIATING TRANSCRIPTIONAL

REPRESSION (URS1) AND ACTIVATION (CAR1). STIMULATES THE ACTIVITY

OF A COGNARTE STRAND EXCHANGE PROPEIN (SEP1). IT COOPERATES WITH

T-AG AND DNA TOPOISOMERASE I TO UNWIND TEMPLATE DNA CONTAINING THE

SIMIAN VIRUS 40 ORIGIN OF DNA REPLICATION.

-! SUBUNIT: HETEROPATHER OF 69, 36, AND 13 KDA CHAINS. THE

DNA-BINDING ACTIVITY MAY RESIDE EXCLUSIVELY ON THE 69 KDA SUBUNIT.
